CMR Code Development

I am a software engineer at the Alaska Satellite Facility and I would like to research how CMR is built and possibly enhance the code to allow more complex searching of additional attributes.

I have cloned a copy of the GitHub repo and in reading how to prepare for development I came across this comment in the repo README.md file...

```
#### Building and Running CMR Dev System in a REPL

1. `cmr setup profile` and then update the new `./dev-system/profiles.clj`
 according to personal instructions provided by a CMR code developer.
```

Does this mean I need a CMR developer to support me in setting up my code for local development? I'm assuming they would supply the authentication information required in the profiles.clj file, and maybe give me some further instructions. Who would I contact for this assistance?

Thanks.
