Redirects

To enter in a redirect or shortcut, click on the redirect symbol (≡) on the Conduit toolbar:

The Redirects page will load, displaying a list of the current redirects in the system. If you need to find a redirect on the page, DO NOT use the Search bar in the upper right (this searches the pages of Conduit). Instead, click on Control-F (Ctrl-F) and the "find" bar will appear within the browser. Enter in the key words and the system will start to find the results that match the word match.

To edit a redirect, click on "Edit" on the right-hand side of the page and the "Edit Redirect" screen will appear for that redirect.
Make any necessary changes or updates, and click on the blue "UPDATE" button. The updates will be applied immediately.

To delete a current redirect, click on "Delete."

To enter in a new redirect, click on the green "NEW REDIRECT" button at the top of the page. A "New Redirect" page will appear.

Enter in the information, noting:

- **Pattern** - this is the OLD URL that you wish to redirect to a new url. It needs to be within the current domain, so it cannot be an outside redirect (from a page outside the Earthdata domain). Enter the Pattern in with the path format, for example, "/the/old/page/url"
- **Target** - this is the NEW URL that you wish the OLD URL to be directed to. It also must be entered in with the path format.

Once this is complete, click on "CREATE" and it will create the redirect and be live within a few minutes after the server updates/refreshes.
