Run LocalStack

LocalStack can save money. It is useful for quick unit testing an AWS service.

Step-by-step guide

You can run locally or via Docker without root permission. By default, Docker is used but you can run it locally, too.

1. ```
   pip install localstack --user
   ```

2. If urllib3 throws an error, update it at user level.

   ```
   pip install urllib3 -U --user
   ```

ⓘ LocalStack now has pro version and free version has many limitations.
