

# CSV Metadata Links

Currently the CSV response format for a granule query seems to only include the "Online Access URL" and "Browse URL" for the granule, but not metadata files associated with the granule. E.g., if I do the same query and request the JSON format, I also get metadata links in addition to the data and browse link.

Is it possible to get metadata links in the CSV format, or would that require a feature request?

We'd like to use the CSV in certain situations as it's easy to parse using standard command-line tools.
