

Is it possible to retrieve a metadata record from the CMR without the <result> wrapper in the XML?

```
curl -X GET "https://cmr.earthdata.nasa.gov/search/collections.native?provider=ges_disc&page_size=2000&concept_id=C1223726607-GES_DISC&pretty=true"
```

returns:

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<results>
```

```
  <hits>1</hits>
```

```
  <took>16</took>
```

```
  <result concept-id="C1223726607-GES_DISC"
```

```
    format="application/dif10+xml" revision-id="26">
```

metadata body....

```
  </result>
```

```
</results>
```
